FORGED PISTONS
4032 Alloy
Installation Instruction

CALCULATING RING END GAP
Top Ring: bore x gap factor (SEE BACK PAGE FOR YOUR SPECIFIC APPLICATION FACTOR) = end gap
Example: 4.030” bore x .004” factor (street naturally aspirated) = .016” minimum gap
Second ring: Naturally Aspirated — .004” per inch of bore min.
Boosted – .005” per inch of bore min.

3 TYPES OF WRIST PIN RETAINING LOCKS ARE USED IN 4032 ALLOY PISTONS

SPIRAL LOCK
1. Spring the lock about 1/8” to 1/4” to get your thumb between the coils.
2. Insert tang into groove. Slightly twist your wrist towards the groove angling the lock downward into the groove.
3. Using a small flat screwdriver push down on the lock to push it into the groove. Continue in a circular rotation. Do not try and spiral the lock in.

TRU-ARC LOCK
• POSITION OPEN END OF LOCK FACING DOWN, SHARP EDGE TO OUTSIDE.

ROUND WIRE LOCK
• POSITION OPEN END OF LOCK FACING DOWN.

NOTE: DO NOT OVER COMPRESS LOCK. DO NOT USE LOCKS WITH A PRESS FIT ROD.

PISTON NOMENCLATURE:

Compression Height
Centerline of wrist pin to top of piston, do not include dome height.

Pistons with Offset Wrist Pins
Direction arrow on top faces to front of engine. This places the short side of the offset to the thrust face of the engine.

Measuring Point
Measure even with the bottom of the wrist pin pad and 90° to the pin.

OIL SUPPORT RAIL:
Applications where the wrist pin is intersecting the oil groove require an Oil Support Rail to bridge the gap the wrist pin cut out has made. All three of the oil control rings are installed on top of the support rail.

Special Note: Raised dimple on support rail is positioned down and indexed in the open area the wrist pin has made in the oil ring groove.

Warranty Disclaimer
Due to the nature of performance applications, the parts sold by United Engine & Machine Co., Inc. are sold without any express warranty or any implied warranty of merchantability or fitness for a particular purpose. UEM shall not, under any circumstances, be liable for any special, incidental or consequential damages, including, but not limited to, damage, loss of profits or revenue, cost of purchased or replacement goods, or claims of customers of the purchaser, which may arise and/or result from said, installation or use of these parts. UEM reserves the right to make product improvements or changes without notice and without incurring liability with respect to similar products previously manufactured.

The information contained in this instruction should not be considered absolute. Final decisions concerning the installation and use of these products are ultimately the responsibility of the customer. UEM makes no guarantees of warranty on emissions.

Final piston clearance should be based solely on the demands of your application. Factors such as fuel type, altitude, outside temp., humidity, tune up, and many others factors need to be taken into account for your final clearance.

Piston Orientation

Quench Area (Yellow): Quench is the area behind the valves. This area should match the flat area on your cylinder head. Proper quench promotes cooling of the piston and can be effective in reducing detonation.

Checking Cylinder Heads: Check cylinder heads with clay or some other method before balancing and final assembly to assure proper piston to head clearance.
